

# ECHO2 PRIORITY COMMUNITIES

The INFORM framework is initially developed on a national level, assigning one risk-score to each country in the world. Recently, they are also developing sub-national models for some countries on provincial or municipal level. For the ECHO2 project we want to go even deeper, and develop a risk-index for each Enumeration Zone within a Traditional Authority. These Enumeration Zones are zones that are used by the Malawi National Statistics Office (NSO). On this very deep geographical level we collect data sources on all components of the INFORM framework: hazards, vulnerability and coping capacity.
